

VIIIBE Investor Deck

Seed Round | Lagos

SLIDE 1 • THE HOOK

GOOGLE MAPS TELLS YOU HOW TO GET THERE.

VIIBE TELLS YOU IF IT'S WORTH GOING.

Friday, 11pm, Victoria Island. Six places you could be. Every one of their Instagram pages says the same thing tonight, because every promoter posts the same thing every night. You pick one, pay ₦10,000 at the door, and walk into a room holding forty people.

You already know how that story ends, because it has happened to you.

SLIDE 2 • THE PROBLEM

AN ECONOMY THIS SIZE SHOULD NOT BE RUNNING ON RUMOUR

Lagos nightlife turns over hundreds of billions of naira a year across roughly four thousand venues. Every other industry that moves money at this scale has an instrument pointed at it. Retail counts footfall. Broadcast has ratings. The roads have live traffic. Nightlife has promoter claims and last week's stories.

Two people lose from that, in different ways.

The person choosing. Instagram is marketing, not information. It is filmed in the one minute the room looked full, posted an hour late, and captioned by someone whose job is to fill the place. There is no independent read anywhere. So six friends open a WhatsApp thread, somebody volunteers to go first, and the verdict arrives too late for anyone to act on.

The owner spending. This is the part outsiders usually get wrong. An owner can see their own floor perfectly well; they are standing on it. What they cannot see is anything outside their own building. Was Saturday good *for a Saturday*, or ordinary? Did the ₦500,000 DJ fill the room, or would it have filled anyway? How many people opened their phone at 10pm, considered this place, and went three streets over instead?

They are handed an outcome with no comparison and no counterfactual, then asked to keep spending against it. That second gap is the one with a budget attached.

SLIDE 3 • THE SOLUTION

A LIVE READING OF A ROOM, TAKEN BY THE PEOPLE STANDING IN IT

VIIIBE makes the crowd the instrument.

Someone inside a venue answers three things in about three seconds: how the energy feels, how full it is, what the door is doing. Their phone confirms they are actually there. That reading joins the others from the same room in the last few minutes, weighted by how reliable that scout has proven to be over time, and it fades out of the score as it ages. What survives is a number for how alive the place is right now, and a city map that glows by it.

The same reading serves three different people:

- Someone deciding where to go sees where the night actually is, before leaving the house.
- A venue sees its own room in context for the first time: where it ranks tonight, how many people are watching it from across the city, and whether the money it spent moved anything.
- Machines read the same feed through an API that is already live in production.

Nothing here is staged, and nothing can be bought. Those two constraints are not policy, they are the product.

SLIDE 3B • THE SPINE

SENSE, READ, SELL

Everything in the product belongs to one of three layers. If a feature cannot be placed in one, it does not ship.

LAYER	QUESTION IT ANSWERS	WHAT LIVES THERE
Sense	Is this real?	Geofenced checks, credibility weighting, sound and tempo, dwell, decay, anti-fake gates
Read	Where should I go?	The live map and heat field, venue detail, peak countdown, the Big Screen
Sell	What is it worth?	Merchant dashboard, watchers, the Lift Report, the agent API

This is also the build order and the pitch order. Supply before product, product before revenue, in that sequence, always.

SLIDE 4 • THE PRODUCT

THREE LINKED PRODUCTS, ONE PLATFORM

The Public App, For Everyone The consumer experience. Find what's live tonight on a real-time map. See which venues are `peak` , `lit` , `charged` , `warming` , `chill` , or `quiet` , all from scouts actually inside right now.

The Merchant Portal, For Venue Owners A private dashboard showing your venue's live performance. Rating volume, energy trend, crowd level, gate reports, historical timeline. Push-notification alerts when your score drops. Paid visibility tools when you need to pull a crowd.

The Admin Console, For Platform Operators Full control over venue listings, merchant accounts, platform economics, and anti-cheat monitoring.

All three share one backend and one MongoDB database. One coherent platform, role-based access.

SLIDE 5 • HOW IT WORKS (THE SCORING SYSTEM)

THE MOST DEFENSIBLE PIECE OF OUR IP

A scout walks into Quilox at 11:30pm and submits a rating in under 60 seconds. They observe:

- **Energy:** What is the room feeling right now? (`quiet` / `chill` / `warming` / `lit` / `peak`)
- **Capacity:** How full is the venue? (`sparse` / `vibrant` / `full`)
- **Gate:** How is entry flowing? (`clear` / `slow` / `blocked`)
- **Vibe-specific:** Optional depth read, e.g., "DJ is killing it" vs "DJ is mellow"

Our scoring engine calculates:

```
Vibe Score = min(100, (Energy × 80% + Context × 20%) × Crowd Multiplier)
```

Energy dominates at 80%. A full venue cannot rescue a dead crowd. A packed house amplifies real energy.

Every score updates with time-decay weighting, a rating from 5 minutes ago counts 3× more than one from 45 minutes ago. When you look at a venue's score, you're seeing the freshest possible picture of the room.

This produces 6 display states:

STATE	TRIGGER	MEANING
PEAK	Score ≥ 85	Maximum energy. Get there now.
LIT	Score ≥ 65	High energy. Night is in full swing.
CHARGED	Score 45–64, crowd full/vibrant	Potential energy, packed, about to blow.
WARMING	Score 45–64, sparse crowd	Building slowly. Check back later.
CHILL	Score 20–44	Low key. Good for a quiet night.
QUIET	Score < 20	Nearly empty. Not tonight.

CHARGED is our unique insight. A packed venue at score 52 is fundamentally different from an empty venue at score 52. CHARGED tells you: 300 people are in the room, the DJ hasn't hit the first drop yet, get there before it blows.

SLIDE 5B • HOW THE ROOM IS SENSED

FOUR SIGNALS, AND THE PEOPLE IN THE ROOM ALWAYS WIN

The score is not a rating average. It is a weighted blend, and the weights are deliberate.

SIGNAL	MAXIMUM WEIGHT	WHAT IT TAKES TO COUNT
Scouts in the room	never below 67%	Geofenced, credibility-weighted
Sound and tempo	up to 15%	Three or more scouts contributing; loudness and music BPM, sampled on device
Scout consensus	up to 10%	Five or more independent scouts agreeing
Dwell time	up to 8%	Five or more people actually staying

No audio ever leaves a phone. Two numbers do: how loud the room is and how fast the music is beating. A lounge at 90bpm and a room at 128bpm can be equally loud and are not the same energy.

Why the floor matters. Sensors can be fooled and rooms can be loud for the wrong reasons. A machine never outvotes the people standing in the room.

SLIDE 5C • THE FRESHNESS PROBLEM

A READING NOBODY REFRESHES IS HOW A MAP STARTS LYING

Energy decays in minutes. A vibe check is accurate for roughly fifteen, and then it quietly becomes fiction while still looking authoritative. Every revenue line in this deck rests on one number staying small.

Pulse Check. When a scout is still inside the venue and their reading is about to expire, they are asked one thing instead of three: is it the same, hotter, or cooling. About two seconds, presence verified, three or four times a night instead of once.

What we measure, and report split between real users and demo activity so neither can flatter the other:

- Median reading age behind each displayed score
- Fresh coverage: the share of venues carrying a reading under fifteen minutes
- Readings per visit, which the prompt should move from roughly one to three
- Pulse Check response rate, which says whether the ask feels like work

Venues with no reading at all count against coverage rather than being skipped. Silence is not freshness.

SLIDE 6 • THE DATA MOAT

WHY THIS GETS HARDER TO REPLICATE OVER TIME

Network effects are the only moat that compounds.

LAYER	WHAT ACCUMULATES
Scout network	More scouts → more coverage → more accurate scores → more useful → more users
Historical snapshots	90 days of nightly data enables Oracle predictions and pattern detection requiring no additional input
Scout accuracy graph	Consistently accurate scouts become elite tier, their reports carry implicit trust
Vibe DNA profiles	Every rating enriches each user's personalised nightlife fingerprint

VIIBE Certified is the trust pinnacle: automatically awarded when a venue hits score ≥ 85 AND 80+ ratings in 24 hours simultaneously. Cannot be bought. Cannot be gamed. Certifies peak human activity with mathematical certainty.

A competitor launching today inherits zero of this. No scout network, no historical baseline, no trust graph, no DNA profiles. They start from scratch on every dimension.

SLIDE 6B • WHY THE SIGNAL CANNOT BE BOUGHT

ANYONE CAN COPY A VENUE LIST. COPYING A NUMBER PEOPLE TRUST IS HARDER.

Any competitor can build a venue list. What is hard to copy is a number that buyers trust enough to spend against. Four enforcement layers, all shipped:

GUARD	WHAT IT PREVENTS
Presence verified	Ratings and reactor charges are geofence checked. Remote hype is damped 5x and can never drive a peak.
Corroboration gated	The top state, which fires city-wide alerts, requires 5+ verified-present scouts, a hot check, and a 10 minute sustained hold. A group chat cannot fake it.
Decay honest	Readings expire in minutes. A venue that was packed at 11 does not stay packed on the map at 2.
Unbuyable score	Paid promotion buys reach, position and a badge. It never touches the number. Enforced in the engine, covered by a regression test.

We would rather show you nothing than lie to you.

That line gets quoted as brand language. It is closer to a commercial precondition. No venue pays for a dashboard its rivals can buy their way up, and no partner licenses crowd data with a price list attached.

SLIDE 6C • WHAT A VENUE ACTUALLY BUYS

DID YOUR ₦500,000 DJ LIFT THE ROOM?

An owner can see their own floor. They are standing on it. What they cannot see is anything outside their building, and that is what we sell.

The Weekly Lift Report. Every Monday morning: intent, verified arrivals, and whether the room lifted against its own four-week baseline, priced in naira. When the baseline is too thin to support a claim, it says so rather than inventing encouragement.

Watchers in orbit. How many people were monitoring this venue from elsewhere in the city and did not come. Live demand pressure, counted, never identified.

The Big Screen. The venue projects its own live energy on the wall. The room watches itself climb the city ranking, which makes the crowd push and puts our instrument in front of every person in the building.

Comparison they cannot get anywhere else. Was Saturday good *for a Saturday*? How did this room rank against the district on the same night?

SLIDE 7 • MARKET SIZE

NIGERIA IS THE PLAYBOOK. AFRICA IS THE PRIZE.

TAM, Total Addressable Market Sub-Saharan Africa entertainment and media economy:

- Nigeria is the #1 fastest-growing E&M market globally (PwC, 8.6% CAGR to 2028)
- Nigeria E&M industry: ~\$14.8–15B (2025 forecast)
- Sub-Saharan Africa recorded music crossed \$100M (2024); Afrobeats global streams +34% in 2024
- Primary nightlife markets: Nigeria, Ghana, Kenya, South Africa, Egypt

SAM, Serviceable Addressable Market Nigeria nightlife, events, and venue discovery:

- 220 million population, median age 18.4
- Nigeria internet users: 107M (45.4% penetration); smartphones: 140M by end of 2025
- Lagos nightlife economy: ~~₦1.5 trillion~~ (\$930M) annually
- Lagos ranked #6 globally for nightlife (Time Out 2024), rising into top 15 in 2025
- 4,000+ licensed venues across 6 major cities
- Lagos top clubs average ₦360M in daily revenue; Detty December 2024 alone generated ₦4.32B across 12 days from clubs, with a total Lagos economic injection of \$71.6M

SOM, Serviceable Obtainable Market (3-year target) Lagos-first, expanding to Abuja + Port Harcourt + Ibadan:

- 50,000 MAU by Month 24
- 500 active merchant venues by Month 24
- ₦250M (\$167K) ARR by end of Year 2

The Afrobeats angle: Nigerian nightlife culture is globalising. VIIBE has a natural export story into African diaspora markets in London, New York, and Toronto, cities where Afrobeats events are among the fastest-growing live entertainment categories.

SLIDE 8 • BUSINESS MODEL

WE SELL THE TRUTH ABOUT A ROOM TO THE PEOPLE WHO OWN IT

The consumer app collects the data. The revenue sits behind it, with three buyers, in this order.

1. Venue Intelligence Subscription, the core line

TIER	PRICE / MONTH	WHAT THE VENUE GETS
Standard	₦25,000	Live energy, watcher counts, weekly Lift Report, district benchmark
Pro	₦75,000	Adds the pre-arrival ops feed, promoter and talent performance, priority support

This works with a handful of scouts and a single venue. No consumer scale is required for it to earn, so the revenue does not have to wait on liquidity. Most apps in this category died waiting.

2. Attribution: the Lift Report, the wedge that opens the door

The most expensive unanswered question in Lagos nightlife is *"did my ₦500,000 DJ, or my ₦2M promoter campaign, actually fill the room?"* Nobody can answer it today. We can, from intent through verified arrivals to energy lift, priced in naira. Free pilot, then it converts to a subscription. **The Lift Report gets the meeting; the subscription is what we sell in it.**

3. Sponsored placement, advertising that cannot corrupt the signal

TIER	PRICE	DURATION	REACH	WHAT IT BUYS
Spark	₦5,000	2 hours	2km	Sponsored badge and reach
Flare	₦15,000	4 hours	5km	Adds a top-3 sponsored slot
Supernova	₦50,000	8 hours	City-wide	Adds the #1 sponsored slot and custom map icon

Promotion buys reach and position. It cannot buy the score. Sponsored venues are rendered as sponsored, the way a paid search result is. The rule is enforced inside the scoring engine, and a test fails the build if anyone re-adds a boost to the maths. Without that rule the rest of this page collapses: a number with a price list is not worth subscribing to.

4. Brand activation intelligence, where the scale revenue is

Guinness, Heineken, Trophy, Hennessy and their agencies spend heavily on Lagos nightlife activation with no targeting data and no verification. We sell both: where to activate this weekend, and whether last week's activation actually lifted the room. Brands can also fund scout reward pools, which is advertising that *creates* real measurement rather than faking it.

- Indicative deal size: **₦2M to ₦5M per agency engagement**
- **Detty December** is the premium window: mid-December to early January, when the diaspora returns with hard currency and zero local knowledge.

5. Longer-dated lines

Table booking commission (rail already live, Lagos tables run ₦100k to ₦2M), site-selection reports for new venues, and API licensing to assistants and mobility platforms.

THE HONEST REVENUE SHAPE

HORIZON	WHAT IT LOOKS LIKE
Months 0–12	20 venues subscribed. Roughly ₦500k/month . Small money, but it is the first evidence that venues will pay at all.
Months 12–24	60+ venues, ops-feed upsells, first brand engagements. ₦2M to 4M/month .
Months 24–36	Brand and data lines lead. ₦10M+/month , with venue SaaS as the reliable base.

These are deliberately unglamorous. A modelled ~~₦45M~~₦45M/month would read better on this page and mean nothing in a diligence call.

SLIDE 9 • TRACTION

BUILT AND RUNNING IN PRODUCTION, SELF-FUNDED

Live infrastructure

- Backend on Railway, database on MongoDB Atlas, public site on Vercel, all in production
- Android builds shipping through EAS: a full build and a compressed launch build from one codebase
- 134 backend tests green

The signal engine (this is the asset)

- Geofenced 3-second vibe checks with per-scout credibility weighting
- Time-decay aggregation: readings expire in minutes, with a live expiry countdown in the app
- Presence verification and 5x damping on remote taps
- Corroboration gate and sustained-hold requirement on the top energy state
- **Paid promotion cannot move the score.** Enforced in the engine, guarded by a regression test
- Peak forecast built from each venue's own history, which stays silent rather than guessing

Revenue surfaces

- Merchant dashboard with live watcher counts (people monitoring a venue from elsewhere)
- Attribution engine: intent through verified arrivals to energy lift, priced in naira, with an honesty gate that refuses to claim lift without a baseline
- Venue Big Screen: a projection page venues put on the wall, which turns the crowd into contributors
- Paystack rails live for merchant wallet, sponsored placement and bookings

Distribution

- Agent API with issued keys and rate limits, live
- MCP server so Claude can query live Lagos energy today
- ChatGPT discovery manifest and OpenAPI spec served in production

WHAT WE HAVE NOT PROVEN YET

Scout density at scale, and repeat scout retention. That is exactly what the next four weekends are designed to test, and it is what this raise funds. We are not claiming traction we do not have.

SLIDE 10 • GO-TO-MARKET

ISLAND-FIRST. COMMUNITY-FIRST. NETWORK-FIRST.

Phase 1, The Island (Months 1–3) Victoria Island, Lekki Phase 1, Ikoyi. Highest venue density, highest smartphone penetration, highest spend per capita.

Activation: 3 "scout ambassador" nights per week. Select 10–15 early users per night, each assigned 2–3 venues. Compensate with VIIBE+ subscriptions (₦2,000/month value). We need their data more than their money in month 1.

Phase 2, The Merchants (Months 3–6) Once 20 venues have 30+ days of live data, the merchant sales conversation is immediate: show them their own dashboard. Live score, crowd trend, timeline. "This is your venue tonight. In real time." Free 30-day trial. No credit card required.

Phase 3, The Flywheel (Months 6–18) Product drives itself. Accelerate with: nightlife content creator partnerships (they embed VIIBE scores in their content), university ambassador programs (Unilag, Covenant, LASU feeder networks into VI), WhatsApp community seeding in existing nightlife groups.

Phase 4, City 2 (Month 12) Abuja. Smaller geography, tight social scene, predictable patterns for Oracle predictions, higher average spend per outing.

SLIDE 11 • COMPETITION

COMPETITOR	WHAT THEY DO	WHY WE WIN
Yelp / Google Reviews	Static, delayed reviews	We are real-time. Reviews are after the fact.
Instagram / TikTok	Curated content by promoters	We are verified, anonymous, anti-bias
Table reservation apps	Booking, not discovery	We solve "where tonight?" not "book my table"
No tool (status quo)	WhatsApp, word of mouth	We are creating a new behaviour, not displacing one

Honest competitive risk: A well-funded international player (Google Maps with live data) could attempt this. But:

- Building a scout network in Lagos requires local trust, local knowledge, and local payment rails, not a cheque.
- Our data moat starts compounding from Day 1. A competitor starting in 12 months inherits nothing.
- We will be the cultural reference for Nigerian nightlife intelligence before they finish due diligence.

SLIDE 12 • TECHNOLOGY

LAYER	TECH	WHY
Frontend	React Native (Expo 54)	iOS + Android + Web from one codebase
State	Zustand v5	Offline-first, zero boilerplate
Backend	FastAPI (Python 3.11)	Async, fast, production-grade
Database	MongoDB Atlas	Flexible schema + native aggregation for scoring
Real-time	Socket.IO	Live score broadcasts, leaderboard updates
AI	Claude (Anthropic)	Night Planner + Vibe Intelligence. Degrades gracefully to rules if API unavailable.
Payments	Paystack (web/B2B) + RevenueCat/Apple IAP (iOS)	Full NG bank + USSD coverage; App Store compliant
Hosting	Vercel + Railway	Zero DevOps overhead. Scale to zero when idle.

AI is a feature, not a dependency. The platform runs without Claude. If the API is unavailable, Night Planner falls back to keyword-based rules. We never put a third-party API on the critical path.

SLIDE 13 • TEAM

(Insert actual team bios here)

Founder / CEO: [Name] Lagos-native. Built [X]. Nightlife obsessive. Prior experience in [relevant domain].

Technical Lead: [Name] Full-stack. Previously [X]. Responsible for all production architecture.

What we're hiring with this round:

- Community Manager, Lagos-based, runs scout ambassador program
 - Backend Engineer, handles roadmap velocity
 - Account Executive, merchant sales and onboarding
-

SLIDE 14 • FINANCIALS SUMMARY

(Full 5-year model in docs/FINANCIAL_MODEL.md)

METRIC	YEAR 1 (2026)	YEAR 2 (2027)	YEAR 3 (2028)
MAU	5,000	25,000	80,000
VIIBE+ Subscribers	250	1,250	4,000
Active Merchants	20	150	500
Revenue (¥)	¥8.3M	¥89M	¥352M
Revenue (USD)	\$5.5K	\$59K	\$235K
Gross Margin	72%	83%	89%
Break-Even	,	Month 18 (Q3 2027)	,

Revenue mix at Year 3 scale: Merchant SaaS 45% · Pulse Drops 30% · VIIBE+ 15% · Data API 10%

Notes:

- Year 1 MAU target of 5,000 is the seed milestone, not post-seed scale.
- Gross margin reflects Apple IAP platform fee (15–30% on iOS consumer subscriptions) at Year 1; improves as web and Android mix grows.

SLIDE 14B • THE TERMINAL THESIS

MOST APPS ARE DISCOVERY TOOLS. VIIBE IS INFRASTRUCTURE.

A terminal implies outputs that other people act on, not just consumers deciding where to go tonight.

OUTPUT	WHO ACTS ON IT
Live energy score per venue	Consumers deciding where to go
Hourly energy curve and peak forecast	Venue owners: staffing, spend, promotions
Pre-arrival intent, who is en route now	Venue operations, before the crowd lands
City-wide heat map, live	Promoters and brands targeting activations
Verified lift attribution	Anyone spending money to fill a room
Movement and taste patterns	Acquirers

THE APP IS THE COLLECTION DEVICE. THE FEED IS THE PRODUCT.

When someone asks **Siri, ChatGPT, Claude or Gemini** "where's good tonight", the answer has to come from somewhere. No incumbent holds live human energy data for African cities. The agent API and an MCP server are live in production today; assistant integrations are the roadmap and the acquirer thesis.

The flywheel: more scouts means a richer signal, a richer signal is worth more to venues and brands, and that revenue funds the scout network.

SLIDE 14C • THE 10/10 MILESTONE

ONE FALSIFIABLE TARGET, AND WE EITHER HIT IT OR WE DO NOT

Four consecutive weekends. 30 or more scouts generating live data across 10 or more Lekki and Victoria Island venues. 1,000 or more users checking the map. Five venues asking for merchant access. Two paying or committed to pay.

Until this is hit, expansion stays frozen. Anything that does not move the corridor toward this number waits.

The metric on the wall is repeat scout rate. Monthly actives can be bought. A scout who came back the following Friday cannot. And a venue writing a cheque because a Monday report showed them something they could not otherwise know is the only evidence that the signal has commercial value.

SLIDE 15 • THE ASK

RAISING A SEED ROUND TO PROVE THE CORRIDOR, THEN PRICE THE LAYER

Use of funds

LINE	%	NOTES
Scout network and corridor operations	30%	Paid founding scouts, promoter partnership, four-weekend proof
Engineering	30%	iOS build, merchant tooling, assistant integrations
Venue and brand sales	22%	Pilot to paid conversion, first agency engagements
Infrastructure and AI	10%	Hosting, model costs, monitoring
Legal, entity, data privacy	8%	

What it buys, stated as falsifiable milestones

- Four consecutive weekends of live corridor data in Lekki and Victoria Island
- 30+ founding scouts, measured on **repeat scout rate**, the only metric that matters early
- 10+ venues carrying continuous live data
- **At least one venue converting from free pilot to paid.** The receipt is the milestone, not the amount
- First brand activation engagement scoped

Why these and not vanity numbers: monthly actives can be bought. A venue writing a cheque because a Lift Report showed them something they could not otherwise know cannot be bought, and it is the only evidence that the signal has commercial value.

Structure: SAFE, standard pro-rata, MFN. No board seat at seed.

VIIIBE. Know before you go.

APPENDIX A, THE CHARGED STATE (DEEP DIVE FOR TECHNICAL INVESTORS)

Investors sometimes ask why 6 states and not a simple 1–5 scale.

CHARGED is the business case for the 6th state.

A venue with score 52 and 300 people inside is fundamentally different from a venue with score 52 and 30 people inside. In the first case: the crowd is assembled, the DJ is about to hit the first peak set, the night is about to explode. In the second: the room is sparse and going nowhere.

Both score 52 on a pure energy calculation. But the correct user action is completely opposite:

- 300-person venue: **"Leave now, you'll miss the peak window."**
- 30-person venue: **"Skip this one."**

CHARGED surfaces this distinction in a single label that users act on in under a second. This is the kind of insight that no static review platform can produce, it requires live data from inside the room combined with crowd context that only a geofenced rating system captures.

APPENDIX B, ANTI-CHEAT SYSTEM (FOR TRUST-FOCUSED INVESTORS)

Five independent layers prevent rating manipulation:

- 1. GPS geofence:** Rating rejected if coordinates are outside venue radius (100m default). You cannot rate a venue you are not physically at.
 - 2. Cooldown system:** 30-minute cooldown between ratings at the same venue. Hard cap of 3 ratings per venue per 24 hours.
 - 3. Burst detection:** Abnormal rating floods are flagged `provisional` and excluded from live aggregates. Coordinated promoter activity cannot move the score.
 - 4. Scout accuracy tracking:** Each scout's ratings are evaluated against venue consensus after-the-fact. Consistently accurate scouts reach `elite` tier. Low-accuracy raters drift toward `newbie`, de-incentivising volume gaming.
 - 5. VIIBE Certified:** Score ≥ 85 AND 80+ ratings simultaneously. Both must be true. Impossible to manufacture without genuine peak activity.
-

APPENDIX C, VIBE DNA AS RETENTION FLYWHEEL

Vibe DNA creates a personalised affinity fingerprint per user from their full rating history. As users rate more venues, DNA becomes richer. The feed sorts venues by DNA match, high-club-affinity users see clubs higher.

The product gets more personalised the more you use it. After 50 ratings, VIIBE knows your nightlife preferences better than you do. After 100 ratings, you stop searching and start trusting the feed.

This is the personalisation compounding loop that consumer apps dream about, a recommendation layer that improves purely as a function of usage, requiring no additional ML infrastructure.

APPENDIX D, NIGHT PLANNER AS FUTURE REVENUE LINE

Currently free (rules-based) with Claude-powered premium path. Natural evolution:

- 1. VIIBE+ gating:** Multi-turn conversations unlimited for subscribers. Direct subscription driver.
- 2. Venue referral model:** Planner recommendations that lead to check-ins earn the merchant a performance credit.
- 3. Branded Planner experiences:** "Guinness Night Planner", F&B brand-sponsored concierge powered by VIIBE data. B2B brand revenue.

Night Planner is currently a feature. It is building toward a dedicated revenue line.

APPENDIX E, VIBEREACTOR & KINETIC INTELLIGENCE

VIIBE'S MOST DISTINCTIVE UX DIFFERENTIATOR

Nothing like VibeReactor exists in any venue app globally. It transforms passive rating into a full-body, real-time participation mechanic.

What it is: VibeReactor is a collective energy mechanism built directly into the scout rating flow. A circular charge ring fills as scouts tap, but the intensity of each tap is measured physically, not just counted.

G-force tap intensity tiers:

TIER	G-FORCE	RESPONSE
Chill	< 1.5g	Standard charge contribution
Lit	1.5g – 2.5g	Enhanced charge, haptic pulse
Peak	> 2.5g	Maximum charge burst, full haptic feedback

The phone's accelerometer reads the velocity of the tap in real-time. A light tap from someone lukewarm about the room contributes less than a hard slam from someone who is genuinely in the moment. Physical intensity becomes a proxy for authentic energy, something no text-based rating system can capture.

Collective mechanics:

- Every scout in a geofenced venue contributes to a shared charge bar
- When the collective bar reaches critical mass, a city-wide surge event triggers
- The GlobalVibePill HUD displays the city's aggregate charge state in real-time, the entire city of Lagos becomes a single organism pulsing with collective energy
- Combo multipliers reward sustained engagement (BPM-driven velocity chains)
- Quest bursts unlock animated reward states

Why this matters for investors: VibeReactor solves the cold-start engagement problem. New users in low-density markets have an intrinsic reason to tap, they are contributing to something larger than their individual rating. The mechanic creates emotional investment in the city's collective charge state. Retention is tied not just to "did I get useful information?" but "did I contribute to tonight's surge?"

This is VIIBE's most defensible product moment. It cannot be replicated by a feature addition to an existing app, it requires the entire scout network, geofence infrastructure, collective state management, and real-time aggregation pipeline to exist first. Incumbents cannot bolt this on.

Contact: [founder@viibe.app] Deck version: March 2026
